

Financial Report Case Study

1. Project Overview

The objective of this financial dashboard project is to provide executive leadership with a comprehensive view of the company's financial and sales performance across countries, customer segments, and discount categories. The dashboard consolidates key performance indicators or metrics such as total revenue, units sold, and profit/loss into an interactive reporting solution that supports strategic decision-making.

The dashboard enables management to monitor monthly revenue trends, evaluate segment performance, analyze country-level financial results, and assess the impact of discount strategies on sales volume. By transforming raw transactional data into visual insights, the solution helps stakeholders identify growth opportunities, operational risks, and areas requiring immediate attention.

This project was designed to support data-driven financial planning, performance tracking, and executive reporting for senior leadership, particularly the CFO and business management teams.

2. Business Questions

1. What is our total revenue performance for the reporting period?
2. How many total units have we sold across all markets and segments?
3. Are we achieving overall profitability, and what is our current profit/loss position?
4. What revenue trends are emerging month over month, and are there any significant spikes or declines that require attention?
5. Which business segments are driving the highest revenue contribution to the organization?
6. How are discount bands impacting overall unit sales performance?
7. Which countries are contributing the strongest results in terms of revenue, units sold, and profit/loss?
8. Which business segments are delivering the best financial performance based on revenue, units sold, and profit/loss?

3. Key Insights???

4. Business Recommendations???
